Econo-me specification

A simple CLI application using Kotlin, *without external libraries*. The application allows users to manage their financial transactions by entering expenses and incomes, which can be organized into categories. It features functionalities such as registering, deleting, and assigning transactions to categories. Users can also retrieve lists of transactions or categories, and view transactions filtered by category.

The code is developed adhering to *clean code principles* and is organized according to *domain-specific* guidelines.

Future enhancements may include implementing AI to automatically categorize transactions based on provided descriptions.
